Education

University of Waterloo — Waterloo, ON
Bachelor of Mathematics in Computational Mathematics — *Sept. 2020 – August 2026*

Technical Skills

Languages: Java, Python, TypeScript, JavaScript, SQL, C/C++, R, Bash, HTML/CSS
Frameworks: Spring Boot, JPA/Hibernate, Angular, React, React Native, Node.js, Express.js, Prisma
Databases & Cloud: PostgreSQL, MongoDB, Redis, Supabase, Firebase, AWS (Lambda, API Gateway, S3, RDS, DynamoDB)
DevOps & Testing: Docker, Kubernetes, Kafka, Keycloak, Git, JUnit, Mockito, Testcontainers, Flyway, REST APIs

Experience

Software Engineer — July – August 2025
Hawala — *Toronto, ON*

- Built a **REST API** on **AWS API Gateway and Lambda** connecting a chatbot to **Supabase** and **OpenAI**
- Reduced average customer support response time by **67%** by automating support workflows
- Developed a hybrid response engine using semantic similarity scoring to choose between predefined FAQ answers and context-aware replies from **OpenAI's API**

Software Engineer — Sep 2024 – Dec 2024
Yaqeen Technology Consulting LLC — *Toronto, ON*

- Developed and maintained a real-time **Call Analytics System** used by multiple clients
- Designed an **AWS** call-scoring pipeline using **Lambda microservices, S3, and Python** for high-volume call data

Full Stack Developer — Sept 2022 – Dec 2022
SS&C Technologies — *Toronto, ON*

- Built an internal tool to migrate cloud database data to a lower-cost store, cutting storage costs by **24%**
- Developed a **Python** application using **Beautiful Soup** to extract critical data from company web sources
- Multi-threaded a **Python** data-processing program, reducing its runtime by **80%**

Projects

FundTrack | *Java, Spring Boot, Angular, PostgreSQL, Kafka, Keycloak, Docker, JUnit* — Nov 2026

- Built a full-stack **mutual fund subaccounting** platform tracking each client's units within a brokerage omnibus account, with an **Angular** frontend and **Spring Boot REST API** over **PostgreSQL**
- Implemented **forward-pricing settlement**: an end-of-day job prices pending orders at the daily NAV with **BigDecimal**, rejects oversells, and runs as one all-or-nothing **transaction**
- Published settlement events to **Apache Kafka** for a separate statement **microservice** backed by **MongoDB**, and secured the API with **Keycloak** (OAuth2/JWT) role-based access
- Wrote **45+ JUnit/Mockito** and **Testcontainers** tests test-first; integration tests caught a Hibernate auto-flush bug that double-counted holdings and was missed by mocks
- Designed the schema with **Flyway** migrations and indexes; used DTOs, Bean Validation, and JPA entity graphs to avoid **N+1 queries**

BestEver | *React, TypeScript, Express, PostgreSQL, Prisma, Docker, Kubernetes, Firebase, AWS* — Sept 2026

- Architected a full-stack polling platform with a **TypeScript/Express REST API** and **React** SPA, enforcing data integrity in **PostgreSQL/Prisma** (e.g. a composite unique constraint blocking duplicate votes)
- Containerized the API with a **multi-stage Docker** build and deployed it to **Kubernetes** with health probes, a ClusterIP Service, and **Secrets**-based configuration
- Deployed the production stack across **Render**, **Vercel**, and **AWS RDS**, with **Firebase Auth** middleware and an explicit CORS allowlist
